A Atlas One

NAIC 2026 · ITEM 3

Real-World Validation

Independent developers used Atlas One with their own GitHub accounts and coding agents. Their sessions are recorded in a signed, append-only log; this report summarises it and includes the external testers' full event log.

Product
Atlas One v1.0

Date
12 October 2026

Live
atlas-one...workers.dev

Source
github.com/agapemiteu/atlasone

2
external testers (own GitHub accounts, own machines, Codex)

2
external apps verified on genuine N-ATLaS

142
events in the signed log (41 external)

14
team verification runs (labelled team, excluded from the summary)

1. How the evidence is collected

Testers sign in with GitHub through their own coding agent. Atlas One records metadata only: who, which agent, which step, its outcome, the request id and timing; never prompts, model output, code or keys. The consent screen tells testers this before they sign in.

LAYER	STANDARD	WHERE
Session log	JSON Lines, ISO 8601 UTC, schema atlas-one.evidence/v1, append-only	`evidence/events.jsonl`; live `https://atlas-one.collins-coordinator-worker.workers.dev/evidence/events.jsonl`
Integrity	SHA-256 digest in a JWT (RFC 7519) signed with EdDSA/Ed25519 (RFC 8037)	`evidence/snapshot.jwt`
Public key	JWK Set (RFC 7517)	`https://atlas-one.collins-coordinator-worker.workers.dev/.well-known/jwks.json`
App proof	Signed receipt (JWT, typ atlas-receipt+jwt) per verified app	Tester's repository, ATLAS_VERIFICATION.jwt
Human view	Per-tester builds, verified request ids, full timeline	`https://atlas-one.collins-coordinator-worker.workers.dev/evidence`

> Snapshot signed 2026-10-12T18:30:17Z with key `atlas-one-2026-10`. `node scripts/verify-evidence.mjs` checks the key, the signature, the digest, the event count, the summary, and that every committed event is still in the live log: **ALL CHECKS PASSED** (6/6).

2. External testers

@agapejustix: two apps built and verified

BUILD	WHAT	VERIFIED REQUEST
`atlas-one-external-beta-shop-2026-10-12`	Hausa customer-support route on the starter shop (Codex, Windows)	`req_eb17493a888e4891a96ef3ea`
`atlas-one-external-beta-shop-2026-10-12`	Second run on the updated site: "Lesson and quiz" (Igbo, structured output)	`req_296170bd3d794f79aab5ae6c`

From the tester's written reports: the receipt was independently verified against the published key (*signature_valid: true*); an unused nonce correctly returned `verified: false`; English, Hausa, Igbo and Yoruba probes all answered correctly; the browser flow worked on desktop and mobile; the key stayed in the ignored server environment file; 12 successful inference requests in the first run.

Quality findings they reported (customer-support scenario, six questions): the price answer was fully correct; the model missed an explicit Abuja delivery fact, did not answer a payment-on-delivery question directly, left a return eligibility unclear, invented "periodic sales", and switched to English when a user insisted. These are model-and-prompt findings, not gateway faults; they shaped the changes in section 4.

@oluwatobiisaiah: evaluation blocked by GPU capacity, which changed the product

Connected through Codex, created project `codex-mcp-evaluation`, then called `atlas_test` five times between 13:52 and 14:03 UTC, each correctly answered `BACKEND_WARMING` (no fabricated output) while Kaggle's free GPU queue held the model server; the agent then used `atlas_inspect` to diagnose. Earlier, his Codex sign-in exposed a Codex bug with the optional RFC 9207 issuer parameter, which Atlas One now works around for all Codex versions. Both findings led to fixes the same day (section 4); his run ended before a verified app.

3. Benchmarks (live)

MEASURE	RESULT	REQUEST ID
Cold start on Modal (container stopped → healthy)	24 s (was 247 s before slimming the image)	
Warm Hausa answer	969 ms through the gateway	`req_f48ae97d5398433ba507939d`
Throughput	27.6 tokens/s (191 Hausa tokens)	`req_5eba2c98f8814bc0acddc710`
Empty folder → verified app (recorded demo, Codex)	6 min 31 s: discover 17:08:01, verified 17:14:32 UTC	`req_c373e5bee04545d4bf9b28c7`
Language probes (external tester)	4/4 correct: en, ha, ig, yo	see Integration Evidence
Automated tests	136 Worker tests in workerd + 6 web tests; live end-to-end gateway 5/5, MCP both protocol eras	

4. What testers changed

FINDING	CHANGE SHIPPED
Status said ready, then the first test hit a cold start	atlas_discover starts waking the model; status carries checked_at

FINDING	CHANGE SHIPPED
Setup took too long	Guide cut from 7 steps to 3; agents get a four-call fast path, the recipe with the key link, and open the key page and .env.local themselves
Key pasted into the wrong file	Agent pre-fills .env.local and names its full path; key page has one Copy key button
Answers missed facts / switched language	Grounding and language guidance in recipes and agent instructions; verify_app states it proves genuine use, not answer quality
Codex sign-in failed ("missing required issuer")	Optional RFC 9207 flag no longer advertised; iss still sent
Model stuck in Kaggle's GPU queue	Compute moved to Modal (L4/A10G fallback, 24 s cold start); Kaggle kept as a one-setting fallback
Feedback form was easy to forget	Agents ask for a rating at a natural pause and record it with atlas_feedback

5. Limits, stated plainly

- Two external testers, one with verified apps; no feedback ratings were submitted yet (0).
- The Atlas One team runs the service that writes the log and holds the signing key. Signatures prove the committed copy matches what the service published and nothing was removed since; independent anchors are the testers' own GitHub accounts and receipts.
- Language quality needs native-speaker review; testers flagged one Igbo greeting as mistranslated.

Appendix A. External testers' full event log

Every recorded event for external testers, from the signed `evidence/events.jsonl`.
